Abstract. The purpose of this study is to design a web-based information system for booking travel tickets and increasing the effectiveness of purchasing travel tickets. To support this research, the author uses descriptive methods for several travel services providers. The results show that there are still some things that become less efficient when consumers are still using conventional methods. From these results, the author still gets many travel service providers who still have difficulty processing ticket booking data. This is because many travel service providers do not trust the internet or information systems that can process order data more effectively and efficiently. Therefore, with a travel ticket ordering information system, it is easier for consumers to order tickets and make it easier for travel service providers to process consumer data.
